

**WIRE**

# America's Premium Magnet Wire Service

45 Progress Avenue • Cranberry Industrial Park  
Cranberry Township, PA USA 16066-3511

## Magnet Wire Fabricated To Your Specifications

Our complete wire inventory is listed on our website at:  
[www.swwireco.com](http://www.swwireco.com)

### Conductor Properties

#### COPPER AND ALUMINUM CONDUCTORS

#### AREA, WEIGHT AND RESISTANCE

WEIGHT OF BARE CONDUCTOR	WEIGHT OF BARE CONDUCTOR (cont'd)
<p><b>Pounds Per 1000 Feet</b>            General Formula: Lbs./M Ft. = 0.000433526 (d) (A)            Copper: Lbs./M Ft. = 0.0038540A            Aluminum: Lbs./M Ft. = 0.0011718A            Where: A = Bare conductor cross-sectional area in Square Mils.            d = Density of conductor, grams/cm<sup>3</sup>.            For round conductor, where the cross-sectional area may be more conveniently expressed in Circular Mils, the following formulas are useful:            General Formula: Lbs./M Ft. = 0.00034047 (d) (D<sup>2</sup>)</p>	<p>Copper: Lbs./M Ft. = 0.003027 D<sup>2</sup>            Aluminum: Lbs./M Ft. = 0.0009203 D<sup>2</sup>            Where: D = Diameter of bare conductor, mils.            d = Density of conductor metal, grams/cm<sup>3</sup>.              Formulas for weight are based on a density of 8.89 for copper and 2.703 for aluminum.    <b>Feet Per Pound</b>            For any conductor, Ft./Lb. = 1000/Lbs./M Ft.</p>

CROSS-SECTIONAL AREA	CONDUCTOR RESISTANCE																
<p><b>Round Wire</b>            Circular Mil Area = D<sup>2</sup>            Square Mil Area = π/4 D<sup>2</sup> = 0.7854 D<sup>2</sup>            Square Inch Area = 0.7854 x 10<sup>-6</sup> D<sup>2</sup>            Where: D = Diameter of bare conductor in mils (1/1000 inches), i.e. 0.0403" Diam. = 40.3 mils</p> <p><b>Square and Rectangular Wire</b>            Circular Mil Area = 1.2732 (Wt - 0.8584R<sup>2</sup>)            Square Mil Area = WT - 0.8584R<sup>2</sup>            Square Inch Area = 1 x 10<sup>-6</sup> (WT - 0.8584R<sup>2</sup>), or            = wt - 0.8584r<sup>2</sup>, when w, t and r are expressed in inches.            Note: 1 sq. mil = 10<sup>-6</sup> sq. inches.            Where: T = Thickness in mils. W=Width in mils.            R = Corner Radius in mils.            For square wire: W = T.            For rectangular wire with full rounded edges:            R = T/2</p> <p>Notes: When calculations involve any of the following standard ASTM corner radii, the values for Corner Area Loss listed below may be substituted for the term "0.8584R<sup>2</sup>" in the above formulas.</p> <table border="1"> <thead> <tr> <th>Nominal ASTM* Corner Radii (Inches)</th> <th>Corner Area Loss Factors</th> </tr> </thead> <tbody> <tr><td>0.094</td><td>7585.</td></tr> <tr><td>0.063</td><td>3407.</td></tr> <tr><td>0.040</td><td>1373.</td></tr> <tr><td>0.032</td><td>879.0</td></tr> <tr><td>0.026</td><td>580.3</td></tr> <tr><td>0.020</td><td>343.4</td></tr> <tr><td>0.016</td><td>219.8</td></tr> </tbody> </table> <p>*ASTM Standard B48-88 for Copper.            *ASTM Standard B324-88 for Aluminum.</p>	Nominal ASTM* Corner Radii (Inches)	Corner Area Loss Factors	0.094	7585.	0.063	3407.	0.040	1373.	0.032	879.0	0.026	580.3	0.020	343.4	0.016	219.8	<p><b>Ohms Per 1000 Feet</b>  <b>Round Conductor:</b>            General Formula: Ohms/M Ft. = 1000 R/D<sup>2</sup>            Copper: Ohms/M Ft. = 10371/D<sup>2</sup>            Aluminum: Ohms/M Ft. = 16782/D<sup>2</sup>              Where R = Volume resistivity, ohm-circ.mil/ft.            D = Bare conductor diameter, mils.</p> <p><b>Square and Rectangular Conductor:</b>            General Formula: Ohms/M Ft. = 785.4 R/A            Copper: Ohms/M Ft. = 8145.5/A            Aluminum: Ohms/M Ft. = 13180/A              Where: R = Volume resistivity, ohm-circ.mil/ft.            Copper = 10.371 ohm-circ. mil/ft.            Aluminum = 16.782 ohm-circ. mil/ft.            A = Cross-sectional area, square mils.</p> <p><b>Ohms Per Pound</b>            For any conductor, Ohms/Lb. = Ohms/M Ft./Lbs./M Ft.</p> <p><b>Feet Per Ohm</b>            For any conductor, Feet/Ohm = 1000/Ohms/M Ft.</p> <p><small>*The volume resistivity factors at 20°C are based on conductivities of 100% and 61.8%. IACS, for soft, annealed copper and aluminum respectively. Conductivities for hard drawn conductors are: Copper 97%; and Aluminum, 61%.</small></p>
